[ZendTo] 5Y Data Request

Inbox

ZendTo <noreply.zendto@eskom.co.za> Fri, Mar 8, 10:31 AM (3 days ago)

to
me

This is an automated message sent to you by the ZendTo service.

Eskom Automation <noreply.portal@eskom.co.za> has dropped off a file for you.

IF YOU TRUST THE SENDER and are expecting to receive a file from them, you may choose to retrieve the drop-off by clicking the following link (or copying and pasting it into your web browser):

https://zendto.eskom.co.za/pickup?claimID=rdkqXdn2Udun4uz3&claimPasscode=2WbpNXmkjh5izpQg&emailAddr=49846

You have 21 days to retrieve the drop-off; after that the link above will expire.
If you wish to contact the sender, just reply to this email.

The sender has left you a note:

Requested files

Full information about the drop-off:

Claim ID:	rdkqXdn2Udun4uz3
Claim Passcode:	2WbpNXmkjh5izpQg
Date of Drop-off:	2024-03-08 10:31:05

— Sender —

Name:	Eskom Automation
Organization:	Eskom
Email Address:	noreply.portal@eskom.co.za

— File —

Name:	ESK8572.csv
Description:	Eskom 5Y Data Request
Size:	12.7 MB

Support

Dear Tshingombe,

I am contacting you concerning the support case 2403050030003623.

I have tried contacting you at +27 725298946, however, I have been unable to reach you.

Please note that I have not received any updates from you for more than two business days.

Please respond to this email letting me know if your issue is resolved or if you still need help.

In case we do not receive your reply within the next two business days, your case will be closed.

Should you have any questions or require assistance, please do not hesitate to contact us.

Looking forward to hearing from you.

Kind Regards,
Mark

Support

Dear Tshingombe,

Thank you for your email.

I have tried contacting you at +27 725298946, however, I have been unable to reach you.

I would like to inform you that you have reached the Azure for Education support.

In order for me to be able to assist you further, please provide me with a detailed description of your query.

As soon as I receive the above-mentioned details, I will be happy to assist you further.

I am looking forward to your reply.

Kind Regards,
Mark

Workflow file for this run

.github/workflows/terraform.yml at 8d5a91b

```
# This workflow installs the latest version of Terraform CLI and configures the Terraform CLI configuration file
# with an API token for Terraform Cloud (app.terraform.io). On pull request events, this workflow will run
# `terraform init`, `terraform fmt`, and `terraform plan` (speculative plan via Terraform Cloud). On push events
# to the "main" branch, `terraform apply` will be executed.
#
# Documentation for `hashicorp/setup-terraform` is located here: https://github.com/hashicorp/setup-terraform
#
# To use this workflow, you will need to complete the following setup steps.
#
# 1. Create a `main.tf` file in the root of this repository with the `remote` backend and one or more resources defined.
# Example `main.tf`:
# # The configuration for the `remote` backend.
#
terraform {
# backend "remote" {
# # The name of your Terraform Cloud organization.
# organization = "example-organization"
#
# # The name of the Terraform Cloud workspace to store Terraform state files in.
```

```
#
workspaces
{
# name = "example-
workspace"
#
}
#
}
#
}
#
# # An example resource that
does nothing.
# resource "null_resource"
"example" {
# triggers
= {
# value = "A example resource that
does nothing!"
#
}
#
}
#
#
# 2. Generate a Terraform Cloud user API token and store it as a GitHub
secret (e.g. TF_API_TOKEN) on this repository.
#
Documentatio
n:
# - https://www.terraform.io/docs/cloud/users-teams-
organizations/api-tokens.html
# - https://help.github.com/en/actions/configuring-and-managing-
workflows/creating-and-storing-encrypted-secrets
#
# 3. Reference the GitHub secret in step using the `hashicorp/setup-
terraform` GitHub Action.
#
Example:
# - name: Setup
Terraform
```

```
# uses: hashicorp/setup-
terraform@v1
#
with:
# cli_config_credentials_token: $
{{ secrets.TF_API_TOKEN }}

.github/workflows/azure-webapps-node.yml

Create aws.yml tshing #2

Workflow file for this run

.github/workflows/azure-webapps-node.yml at 2baf1d4

This workflow will build and push a node.js application to an Azure Web App when a commit is pushed to your default branch.
#

This workflow assumes you have already created the target Azure App Service web app.
For instructions see https://docs.microsoft.com/en-us/azure/app-service/quickstart-nodejs?tabs=linux&pivots=development-environment-cli
#
To configure this workflow:
#
1. Download the Publish Profile for your Azure Web App. You can download this file from the Overview page of your Web App in the Azure Portal.
For more information: https://docs.microsoft.com/en-us/azure/app-service/deploy-github-actions?tabs=applevel#generate-deployment-credentials
#
2. Create a secret in your repository named AZURE_WEBAPP_PUBLISH_PROFILE, paste the publish profile contents as the value of the secret.
For instructions on obtaining the publish profile see: https://docs.microsoft.com/azure/app-service/deploy-github-actions#configure-the-github-secret
#
3. Change the value for the AZURE_WEBAPP_NAME. Optionally, change the AZURE_WEBAPP_PACKAGE_PATH and NODE_VERSION environment variables below.
#
For more information on GitHub Actions for Azure: https://github.com/Azure/Actions

Deploy to Amazon ECS

Create tencent.yml eng #2

-

Workflow file for this run

.github/workflows/aws.yml at 8d5a91b

```
# This workflow will build and push a new container image
to Amazon ECR,
# and then will deploy a new task definition to Amazon ECS, when there
is a push to the "main" branch.
#
# To use this workflow, you will need to complete the
following set-up steps:
#
# 1. Create an ECR repository to store
your images.
# For example: `aws ecr create-repository --repository-name my-ecr-repo
--region us-east-2`.
# Replace the value of the `ECR_REPOSITORY` environment variable in
the workflow below with your repository's name.
# Replace the value of the `AWS_REGION` environment variable in the
workflow below with your repository's region.
#
# 2. Create an ECS task definition, an ECS cluster, and
an ECS service.
# For example, follow the Getting Started guide on
the ECS console:
# https://us-east-2.console.aws.amazon.com/ecs/home?
region=us-east-2#/firstRun
# Replace the value of the `ECS_SERVICE` environment variable in the
workflow below with the name you set for the Amazon ECS service.
# Replace the value of the `ECS_CLUSTER` environment variable in the
workflow below with the name you set for the cluster.
#
# 3. Store your ECS task definition as a JSON file in
your repository.
# The format should follow the output of `aws ecs register-task-definition
--generate-cli-skeleton`.
```

```
# Replace the value of the `ECS_TASK_DEFINITION` environment
variable in the workflow below with the path to the JSON file.
# Replace the value of the `CONTAINER_NAME` environment variable in
the workflow below with the name of the container
# in the `containerDefinitions` section of the
task definition.
#
if
# 4. Store an IAM user access key in GitHub Actions secrets named
`AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY`.
# See the documentation for each action used below for the
recommended IAM policies for this IAM user,
# and best practices on handling the access
key credentials.

Deploy to Amazon ECS

Create ibm.yml engineering #3

-

Workflow file for this run

.github/workflows/aws.yml at c91017a

```
# This workflow will build and push a new container image
to Amazon ECR,
# and then will deploy a new task definition to Amazon ECS, when there
is a push to the "main" branch.
#
# To use this workflow, you will need to complete the
following set-up steps:
#
# 1. Create an ECR repository to store
your images.
# For example: `aws ecr create-repository --repository-name my-ecr-repo
--region us-east-2`.
# Replace the value of the `ECR_REPOSITORY` environment variable in
the workflow below with your repository's name.
# Replace the value of the `AWS_REGION` environment variable in the
workflow below with your repository's region.
#
# 2. Create an ECS task definition, an ECS cluster, and
an ECS service.
# For example, follow the Getting Started guide on
the ECS console:
# https://us-east-2.console.aws.amazon.com/ecs/home?
region=us-east-2#/firstRun
# Replace the value of the `ECS_SERVICE` environment variable in the
workflow below with the name you set for the Amazon ECS service.
# Replace the value of the `ECS_CLUSTER` environment variable in the
workflow below with the name you set for the cluster.
#
# 3. Store your ECS task definition as a JSON file in
your repository.
# The format should follow the output of `aws ecs register-task-definition
--generate-cli-skeleton`.
# Replace the value of the `ECS_TASK_DEFINITION` environment
variable in the workflow below with the path to the JSON file.
```

Replace the value of the `CONTAINER_NAME` environment variable in the workflow below with the name of the container
in the `containerDefinitions` section of the
task definition.
#
if
4. Store an IAM user access key in GitHub Actions secrets named `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY`.
See the documentation for each action used below for the recommended IAM policies for this IAM user,
and best practices on handling the access
key credentials.

.github/workflows/tencent.yml

Create ibm.yml engineering #2

-

Workflow file for this run

.github/workflows/tencent.yml at c91017a

This workflow will build a docker container, publish and deploy it to Tencent Kubernetes Engine (TKE) when there is a push to the "main" branch.
#
To configure this workflow:
#
1. Ensure that your repository contains the necessary configuration for your Tencent Kubernetes Engine cluster,
including deployment.yml, kustomization.yml, service.yml, etc.
#
2. Set up secrets in your workspace:
- TENCENT_CLOUD_SECRET_ID with Tencent Cloud secret id
- TENCENT_CLOUD_SECRET_KEY with Tencent Cloud secret key
- TENCENT_CLOUD_ACCOUNT_ID with Tencent Cloud account id
- TKE_REGISTRY_PASSWORD with TKE registry password
#
3. Change the values for the TKE_IMAGE_URL, TKE_REGION, TKE_CLUSTER_ID and DEPLOYMENT_NAME environment variables (below).

# 2. Create a secret in your repository named AZURE_WEBAPP_PUBLISH_PROFILE, paste the publish profile contents as the value of the secret.
```

For instructions on obtaining the publish profile see: https://docs.microsoft.com/azure/app-service/deploy-github-actions#configure-the-github-secret
#
3. Change the value for the AZURE_WEBAPP_NAME. Optionally, change the AZURE_WEBAPP_PACKAGE_PATH and NODE_VERSION environment variables below.

# This workflow will build a docker container, publish and deploy it to Tencent Kubernetes Engine (TKE) when there is a push to the "main" branch.
#
# To configure this workflow:
#
# 1. Ensure that your repository contains the necessary configuration for your Tencent Kubernetes Engine cluster,
#    including deployment.yml, kustomization.yml, service.yml, etc.
#
# 2. Set up secrets in your workspace:
#    - TENCENT_CLOUD_SECRET_ID with Tencent Cloud secret id
#    - TENCENT_CLOUD_SECRET_KEY with Tencent Cloud secret key
#    - TENCENT_CLOUD_ACCOUNT_ID with Tencent Cloud account id
#    - TKE_REGISTRY_PASSWORD with TKE registry password
#
# 3. Change the values for the TKE_IMAGE_URL, TKE_REGION, TKE_CLUSTER_ID and DEPLOYMENT_NAME environment variables (below).

name: Tencent Kubernetes Engine

```
# This workflow installs the latest version of Terraform CLI and configures the
Terraform CLI configuration file
# with an API token for Terraform Cloud (app.terraform.io). On pull request events, this
workflow will run
# `terraform init`, `terraform fmt`, and `terraform plan` (speculative plan via Terraform
Cloud). On push events
# to the "main" branch, `terraform apply` will be executed.
#
# Documentation for `hashicorp/setup-terraform` is located here:
https://github.com/hashicorp/setup-terraform
#
# To use this workflow, you will need to complete the following setup steps.
#
# 1. Create a `main.tf` file in the root of this repository with the `remote` backend and
one or more resources defined.
#   Example `main.tf`:
#     # The configuration for the `remote` backend.
#     terraform {
#       backend "remote" {
#         # The name of your Terraform Cloud organization.
#         organization = "example-organization"
#
```

```
#         # The name of the Terraform Cloud workspace to store Terraform state files in.
#         workspaces {
#           name = "example-workspace"
#         }
#       }
#     }
#
#     # An example resource that does nothing.
#     resource "null_resource" "example" {
#       triggers = {
#         value = "A example resource that does nothing!"
#       }
#     }
#
#
# 2. Generate a Terraform Cloud user API token and store it as a GitHub secret (e.g. TF_API_TOKEN) on this repository.
#   Documentation:
#     - https://www.terraform.io/docs/cloud/users-teams-organizations/api-tokens.html
#     - https://help.github.com/en/actions/configuring-and-managing-workflows/creating-and-storing-encrypted-secrets
#
# 3. Reference the GitHub secret in step using the `hashicorp/setup-terraform` GitHub Action.
#   Example:
#     - name: Setup Terraform
#       uses: hashicorp/setup-terraform@v1
#       with:
#         cli_config_credentials_token: ${{ secrets.TF_API_TOKEN }}

name: 'Terraform'

on:
  push:
    branches: [ "main" ]
  pull_request:

permissions:
  contents: read

jobs:
  terraform:
    name: 'Terraform'
    runs-on: ubuntu-latest
    environment: production

    # Use the Bash shell regardless whether the GitHub Actions runner is ubuntu-latest, macos-latest, or windows-latest
    defaults:
      run:
        shell: bash

    steps:
    # Checkout the repository to the GitHub Actions runner
```

```
    - name: Checkout
      uses: actions/checkout@v3

    # Install the latest version of Terraform CLI and configure the Terraform CLI
configuration file with a Terraform Cloud user API token
    - name: Setup Terraform
      uses: hashicorp/setup-terraform@v1
      with:
        cli_config_credentials_token: ${{ secrets.TF_API_TOKEN }}

    # Initialize a new or existing Terraform working directory by creating initial files,
loading any remote state, downloading modules, etc.
    - name: Terraform Init
      run: terraform init

    # Checks that all Terraform configuration files adhere to a canonical format
    - name: Terraform Format
      run: terraform fmt -check

    # Generates an execution plan for Terraform
    - name: Terraform Plan
      run: terraform plan -input=false

      # On push to "main", build or change infrastructure according to Terraform
configuration files
      # Note: It is recommended to set up a required "strict" status check in your
repository for "Terraform Cloud". See the documentation on "strict" required status
checks for more information: https://help.github.com/en/github/administering-a-
repository/types-of-required-status-checks
    - name: Terraform Apply
      if: github.ref == 'refs/heads/"main"' && github.event_name == 'push'
      run: terraform apply -auto-approve -input=false
```
